

How to make an AI storybook

Outline it, let AI write it, find the style, put it online. Keeping one character the same on every page is the hard part.

01 Outline it

Write how the story goes. Short is fine.

- One line per page. 8 to 12 pages.
- Who is in it, what happens, how it ends.
- By hand. This part is yours.

02 Let AI write it

Give the outline to a model and let it write the pages.

- A good outline is enough for any model to write from.
- Revise every page yourself. The draft comes back generic.
- Lock the words before any art. A line changed later means pages redrawn.

03 Find the style

Use Gemini with Nano Banana Pro, or another continuity keeping tool.

- Gather a few inspo pics of the look you want. Describe that style in one paragraph.
- Paste that paragraph, and a head to toe description of each character, into every prompt. Never reword them.
- Let AI turn each outline line into a scene prompt.
- Let AI compile the pictures with the story.
- One chat for the whole book.

04 Put it somewhere

Two endings.

- A website. Claude Code or Codex writes the HTML. GitHub Pages hosts it free.
- A PDF. Drop the images into a layout and export. No code needed.

FABLEWICK, THE SAME 3 STEPS

- 1 11 books written and locked before a single picture.
- 2 66 illustrations. One chat per book, the same style paragraph in every prompt.
- 3 One HTML reader per book, pushed to GitHub Pages.

The same pipeline ran a second collection, 5 books, in a day.

SOURCES & NOTE

Sources: Google AI plan names and pricing, gemini.google and Google One, read August 26th 2026; Nano Banana Pro, underlying model Gemini 3 Pro Image, deepmind.google, read August 26th 2026; Fablewick figures from the build record, mannp09.github.io/fablewick.

Image generation is compute metered, so a long session can slow down or drop to a weaker model. Work in one sitting and stop when the quality dips. AI generated art of a real person stays private and stays kind.

Glossary

Outline One line per page, written by hand before anything is generated.

Style paragraph One paragraph describing the illustration style. Pasted into every prompt unchanged.

Character block One paragraph describing a person head to toe. Pasted into every prompt unchanged.

Scene prompt One outline line turned into an instruction for the image tool.

Drift A character slowly changing across pages. The main failure of an AI storybook.

Quality mode The slower, better image setting. Mixing it with the fast setting inside one book breaks the look.

Nano Banana Pro Google's image model, underlying name Gemini 3 Pro Image. Reached through a Google AI Pro plan.

Google AI Pro The \$19.99 per month Google plan. There is also a cheaper Google AI Plus, a different and weaker plan.

Compute metered Limits measured by processing used rather than pictures made, so heavy sessions throttle sooner.

Claude Code A coding tool that writes and edits files from plain instructions. Codex is the equivalent from OpenAI.

GitHub Pages Free hosting for a static site, straight from a repo.

Fablewick Mann's open storybook library. 11 books, 66 illustrations, built with this pipeline.
