

What a private licence costs, and why it cannot pay you back

Two questions, and only one of them is about money. The cost is a range you can plan around. **The income is zero, and that is written into federal regulation rather than into market conditions.**

CONTENTS

- 01 The licence
- 02 The wall
- 03 Getting paid
- 04 The math
- G Glossary

01 The licence

What it actually takes to fly yourself and a few passengers.

- The **FAA** (Federal Aviation Administration) minimum is **40 hours**. The national average is **60 to 75**, and most students finish between **50 and 70**. **high**
- A **dual hour** (one hour of flying with an instructor beside you) runs about **\$200 to \$280** in 2026. The aircraft is \$140 to \$220 at the wet rate, the instructor \$50 to \$90. **high**
- **Realistic all in: \$12,000 to \$18,000**. Schools advertising \$8,500 are quoting the 40 hour minimum that almost nobody hits. **high**
- On top of the flying: a third class medical at **\$100 to \$200**, a written test, a checkride, a headset and books. **medium**
- Once you hold it, you may carry passengers immediately. **The licence does not limit how many people you fly, only why. verified**

02 The wall

This is the answer to whether it generates money, and it is not a market opinion.

- 14 CFR (Code of Federal Regulations) 61.113(a), word for word: **no person who holds a private pilot certificate may act as pilot in command of an aircraft that is carrying passengers or property for compensation or hire. verified**
- You may split costs, and the regulation lists exactly which ones. **Fuel, oil, airport expenditures, or rental fees**. Nothing else. **verified**
- You must also pay at least your own **pro rata share** (your equal slice, counting yourself as one of the people on board). Three friends and you means you pay a quarter at minimum. **You cannot fly for free, let alone for profit. verified**
- The FAA reads compensation very broadly. Money, goodwill, logged flight time and future business favours have all counted. **medium**

THE KEY IDEA

A private certificate is a permission to fly people, and a prohibition on being paid for it. **Those are the same document.**

03 Getting paid

What it takes to legally earn a dollar in a cockpit.

- A **commercial certificate** (the licence that permits flying for compensation) requires **250 total hours**. **high**
- Cost above the private licence is quoted anywhere from **\$25,000 to \$60,000**. **Sources disagree by a wide margin, not a narrow one, so no single number in that range earns more trust than the rest.** **medium**
- Then an instructor rating at **\$6,500 to \$11,000**. Instructing is how nearly everyone builds hours, because the hours pay for themselves. **medium**
- Instructor pay in 2026 is roughly **\$45 to \$55 an hour**, or **\$55,000 to \$65,000** a year full time. **medium**
- Flying charter passengers wants **500 hours** for daytime visual work and **1,200 hours** for most captain seats, plus an instrument rating. **high**

04 The math

Whether it pays back, worked out both ways.

- **On the private licence alone the payback period does not exist.** Revenue is zero by regulation, so no number of passengers and no number of years recovers the \$12,000 to \$18,000. **derived**
- To reach the first legal dollar: private plus commercial plus instructor is roughly **\$45,000 to \$85,000** and **250 hours**. **derived**
- At \$55,000 a year gross an instructor recovers that in **one to two years** of full time work. **That is a job, not a return on a hobby.** **derived**
- Running costs either way: a flight review every 24 months at **\$200 to \$500**, a medical renewal, and renters insurance from **\$81 to \$400** a year. Budget **\$1,000 to \$3,000** annually. **medium**

THE ONE LINE

Price it as a thing you buy, not a thing you build. The licence is a consumption good, and everything past it is a career change rather than a return.

SOURCES & NOTE

Sources: 14 CFR 61.113, quoted verbatim from the Cornell Legal Information Institute text of the regulation, retrieved August 8 2026; Part 135 crewmember minimums, 14 CFR Part 135 Subpart E, cross checked against two 2026 industry summaries; Cost, hour and pay figures: several independent 2026 flight training cost surveys, banded rather than averaged where they disagreed; Cessna 172 rental median of \$176 per hour across 1,586 aircraft nationwide, April 2026.

Educational, not financial or legal advice. Regulations change and the FAA is the only authority on what they mean.

Confidence tags describe how well sourced a number is, not how likely it is to hold for any one school or student.

Glossary

Pilot in command [PIC](#) The pilot legally responsible for the flight. The rules attach to this role rather than to who is holding the controls.

Checkride The practical exam with an examiner. Passing it is what converts training into a certificate.

Flight review [BFR](#) A short refresher flight with an instructor, required every 24 calendar months to keep flying legally.

Instrument rating [IR](#) An add on that permits flying in cloud and poor visibility. Required for most paid passenger work.

Part 135 The federal rules covering charter and on demand passenger flights. Carrying paying passengers almost always happens under these.

Wet rate An aircraft rental price that already includes fuel. A dry rate does not, and the difference is large.
